The present invention relates to linkage methodology for use in the conjugation of compounds (e.g. peptides) to carrier vehicles

(e.g. racionolecules, polymeis, dendriments, proteins) to produce

(e.g. racionolecules, polymeis, dendriments, proteins) to produce

(biological and immunological constructs. The invention provides a

method for linking an epistope (e.g. a peptide) to a carrier (e.g. a

protein) for use in a pharmaceutical composition or a vaccine. The

invention describes peptides derived from or mimotopes of the

Chepsilon2, Cepsilon3 or Cepsilon3 regions of human immunoglobulin E

(19E) which are used to produce conjugated compounds. The compounds or

compositions of the invention are useful in the manufacture of a

medicament for the treatment of 19E mediated diseases. The invention

allows for controlled conjugation of a peptide epitope (antigen) to a

protein so a to form an immunogenic conjugate which may be able to

raise a protective antibody response in an animal or human patient.

Addiedia-Addiedia ispresent peptides derived from or mimotopes of

the Cepsilon2/Cepsilon3/Cepsilon4 region of human 19E.
                                                                                                                                                                                                                                                                         A linkage comprising an immunogenic conjugate useful treatment of 14E mediated discases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Immungen; human; TyF; immuncylopulin E; allergy; thio-ether linkage;

Also described are: (%) a cytotoxic T lymphocyte (%), the isolated (%) continued (%) in vivo and binds to a complex of (%); (%) a peptide (%); (%) and a second epitope and has less than $0 continued among acids (%) a unit dose of a peptide with less than $0 contiguous among acids with 10% identity (%) the native peptide sequence of $5$, and a pharmaceutical octivient; (%) an isolated nucleic sequence of $5$, and a pharmaceutical octivient; (%) an isolated nucleic acid encoding (%) and ($) an isolated nucleic acid encoding (%) and ($) an isolated nucleic acid encoding (%) and (%) and (%) an isolated nucleic acid encoding (%). The above of the encoding (%) are useful for treating or preventing number responses. Unlike conventional epitopes, immunostypic estimates that may be present in whole antigens can be avoided with the user of the varione composition of (%). The ability to combine science after the varione
                                                         The present invention relates to conjugates suitable for use in vaccines, where the conjugate comprises a disalphide bridge oyelised peptide and an armonogenic carrier. The vaccines can be used in the treatment of allergies, the present sequence is a peptide immunogene desixed from human armonoglobulin E (19E) suitable to be cyclised and used in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Epitope based vaccines comprising 153 epitope biomer a specifical sequences, useful for treating and proventing factors. The proping peptides is useful as diagnostic agents and for evaluating influence response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, p33, turour suppressor, human leukocyte antigen, HTA, CTI, cytotoxic T lymphocyte; T cell, immune response, tumbut, cancery vaccine, epitope, cytostatic.

The present invention describes a method for monitoring 159P1H4 gene products in a biological sample from a patient who has or is suspected of having cancer. The method comprises determining the status of 158P1H4 gene products in a tissue sample from an individual, comparing the gratus to the status of 158P1H4 gene products in a normal sample, and identifying the presence of aberrant 158P1H4 gene products in the sample. 158P1H4 gene products in the sample. 158P1H4 genences have cycostairs activity and can be used in vaccine production. 158P1H4 polynucleotides may be used in monitoring genetic abnormalities. The 158P1H4 proteins may be used in monitoring genetic abnormalities. The 158P1H4 proteins may be used in assessing the status of 158P1H4 gene products in normal versus cancerous tissues and so elucidating the malignant phenoxype, in generating and characterising domain-specific antibodies, for identifying agents or callular factors cancer vaccines. Antibodies against 158P1H4 are useful in diagnostic and prognostic assays, in treating patients with cancer, in generating

char teat by this Monitoring 158P1H4 gene products in high-graf sample, four partent with as suspected of having cancer, useful for treating cancer, comprises identifying presence of abeliant 158P1H4 year products in biological sample

Claim 64; Page 149; 209pp; English.

The present invention describes a method for monitoring 158PH4 gene of induces in a biological sample from a patient who has or is suspected to having cancer. The method comprises determines in status of 158PH4 gene products in a tissue sample from an individual, comparing the status of 158PH4 gene products in a normal sample, and dentifying the presence of aberrant 158PH4 gene products in the sample, production. 158PH4 sequences have cytostatic activity and can be used in vaccine production. 158PH4 gene products may be used in assessing the status abnormalities. The 158PH4 proteins may be used in assessing the status elicibilities. The 158PH4 proteins may be used in assessing the status delicibilities in the infinal versus cancerous tissues and so elucidating the ralignant phenotype, if generating and characterising domain specific antibodies, for identifying agents or cellular factors that bind to 158PH4 or its particular domain, and for generating

The method comprises determining the status of 158P;H4 gene products in a tissue sample from an individual, comparing the status to the status of 158P;H4 gene products in a normal sample, and identifying the presence of abertant 158P;H4 gene products in the sample. 158P;H4 sequences have cytostatic activity and can be used in vaccine production. 158P;H4 polynucleotides may be used in monitoring genetic about mitties. The 158P;H4 proteins may be used in assessing the status of 158P;H4 gene products in normal versus cancerous lissues and so elucidating the malignant phenotype, in generating and characterising
             and prognostic assays, in treating patients with cancer, in generating cytocoxic I lymphocyte (TL) or helper I lymphocyte (HTL) responses, and as a menunoidaical reagents for decering 188PH4-expressing cells. The anibodies are particularly useful in bladder cancer diagnostic prognostic assays, and inaging methodologies. The 158PH4 gene has been located to chromosome 8q22-q23, and the 158PE4 gene also described in the present invention has been located to chromosome 8q22, and the present sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Monitoring 158PiH4 gene products in biological sample from patient who has or is suspected of having cancer, useful for treating cancer, comprises identifying presence of aberrant 158PiH4 gene products in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, 158P1H4; chromosome 8q220q23, 156P1F4; chromosome 8q23; cancer, bladder cancer, immune response; cytotoxic Tlymphocyte; CTL; HLA; human leukocyte antigen; helper Tlymphocyte; HTL.

The method comprises determining the enquise in 158P184 gene products in a tissue sample from an individual, comparing the status to the status of 158P184 gene products in a hormal sample, and adentifying the presence of aberrant 158P184 gene products in the sample, 158P184 sequences have cytostatic activity and can be used in vaccine production. 158P184 polymorbolides may be used in restricting denotice abnormalities. The 158P184 problems may be used in restricting of status.
                                                         and prognostic assays, in treating patients with cancer, in generating exponents. Tymphocyte (CTL) or helper T lymphocyte (HTL, responses, and as ammunological reagents for detecting 158PlH4 expressing cells. The antibodies are particularly useful in bladder cancer diagnostic and prognostic assays, and imaging methodologies. The 158PlH4 gene has been located to chromosome 8q22-q23, and the 158PlH4 gene has been located to chromosome 8q22-q23, and the present invention has been located to chromosome 8q23, A5L56420 to ABL5642, and ABB94468 to ABB95188 represent equences used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, 186P1H4; chromosome 8q220q2;, 188P1F4; chromosome 8q22, cancer;

of 158P1H4 gene products in normal versus cancerous tissues and so elucidating the malignant phenotype, in generating and characterising domains specific antibodies, for identifying agents or cellular factors that bind to 158P1H4 or its particular domain, and for generating cancer vaccines. Antibodies against 158P1H4 are useful in diagnostic and prognostic assays, in tracting patients with cancer, in generating cytoxoxic 7 lymphocyte (CTL) or helper 7 lymphocyte (HTL) responses, and as immunological reagents for detecting 158P1H4 expressing cells. The antibodies are particularly useful in bladder cancer diagnostic and prognostic assays, and imaging methodologisms. The 158P1H4 gene has been jocated to chromosome 8422-423, and the 158P1F4 gene also described in the present invention has been located to chromosome 8424. ABL50400 to ABL50429 and ABB94468 to ABH59188 represent sequences used in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 insulin receptor substrate-i (IRS-1). These fragments were used to determine the sequence of IRS-1 and to distinguish it from proteins which are co-puried with it. Antibodies were raised against the IRS-1 proteins and were used to remove them from the reaction media. These peptides were formed by proteolytic cleavage of proteins (Updated by 12-SDS PAGE to be approx. 185 kD. (Updated on 25-MAR 208) to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Purified nucleic acid encoding Insulin Receptor Substrate - used to prepare IRS-1, for diagnosis and treatment of insulin related diseases and abnormal cellular proliferation
                                                                                                                                                                                                                                                                                                                                                            .,

Saccharomyces cerevisiae, complementary peptide, peptide identification,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, 1887144: chicrosome *4220423, 188PiP4; chromosome 8q23; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 by analysis of protein and nucleotide sequence databases from higher enkaryotic genomes, excluding human and plants. The specific complementary peptides interact with their relevant target proteins encoded in the enkaryore genome. The peptides may be used as leagung and diags for drug discovery and as lead ingands for drug design and duvelopment. The present sequence is a complementary peptide from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to the identification of complementary peptides

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a nethod for monitoring 198964 game products in a biological sample from a patient who has on is supperted of broducts in a tissue sample from an individual, comparing the gene products in a tissue sample from an individual, comparing the status of 1589144 gene products in a tissue sample from an individual, comparing the sample. The status of 1589144 gene products in a normal sample, and 1589144 sequences have cytostatic activity and tall, used in vaccing production. 1589144 proteins may be used in assessing the status of 1589144 proteins may be used in assessing the status of 1589144 proteins may be used in assessing the status of 1589144 proteins may be used in assessing the status of 1589144 proteins may be used in assessing the status of 1589144 proteins may be used in assessing the status of 1589144 proteins may be used in assessing the status of 1589144 proteins may be used in assessing the status of 1589144 proteins and contrained to 1587474 or its particular domain, and contraining the majoration of 1589144 in the tissue of 1589144 in the particular patients with community and contraining products in the present invention has been focused in the present invention has been focused to manage the status of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                              Monitoring 158PlH4 gene products in biological sample trop prinent who has or is suspected of having cancer, useful for theating cancer, comprises identifying presence of abeltant 158PlH4 grop products in
bladder cancer, immune response, cytotoxic T lymphocyle, CTL, HLA, human leukocyte antigen, helper T lymphocyte, HTL.
                                                                                                                                                                                                                                                                                                          Atar DEB, Levin E.

Chendusf M. Mostafavi E,

An insuin-like growth factor binding protein

Claim 10; Page 19, 26pp; Serman

protein (188) constructed using the formula R1-Cri PNC-X2-QC-X3-CWCV X4-C-R2 where cyclic, glycosylated, phosphorylated, acetylated, amidated, sulphated derivatives and fragments of these with the physiological amidated derivatives and fragments of these with the physiological amility of 18P are included and 31NH2 - an amino acid or peptide with a sequence of up to 4: amino acid: tesidues, X1 = a peptide consisting of 24-31 amino acids, X2 = a peptide consisting of 24-31 amino acids, X2 = a peptide consisting of 18-24 amino acids, R2CCC3 = CONH2 or a peptide with up to 12 amino acids. The products of the invention have imminoprotective, antiproliferative, antibodies, inhibitors and cytostatic activity. The 18P peptides, complexes, antibodies, inhibitors and aminoacide, osteoporosis, diabetes, amylamatory and amissense) micleic acids are all useful in the treatment of miscle loss/shrinkage/wastage, osteoporosis, diabetes, inflamatory processes, cancer, inflammatory and neoplastic diseases, growth discuibances, diseases of the bone apparatus and wound or bone heating. The nucleic acids and artisense apparatus and wound or bone heating. The nucleic acids and artisense peptides, etc., can be used in diagnosis of functional deficiencies in hones, muscles, nervous systems, lymph glands, stomach/intestinal tracts, inflammatory and neoplastic processes and also as a marker for cancer. This sequence represents a specific claimed example of a peptide which can occupy the R2 position of the IBP of the oligonucleotides can be used in somatic or non-somatic gene therapy. This invention describes a novel insulin-like growth factor binding

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

Sequence 2, Application US/09081975
Patent No. 6452979
GENERAL INFORMATION:
APPLICANT: Washing
APPLICANT: Washing
TITLE OF INVENTION: METHODS OF IPPACEMENT USING
TITLE OF INVENTION: ANTHRONES AND FROTEINS THERETO, AND USES OF THE
ORRESPONDENCES: 27
CORRESPONDENCES: 27
CORP. BOSTON

Database

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

capsid protein VP-1 - murine policovirus (fragment)
C;Species: murine policovirus, Theiler's encephalomyelitis virus
C;Species: murine policovirus, Theiler's encephalomyelitis virus
C;Date 20-Feb-1995 #sequence_revision 20-Feb-1995 #text_change 20-Feb-1995
C;Accession: Piol84; A: Hogle, J.M.; Fujinami, R.S.
B;Zurbriggen, A.; Hogle, J.M.; Fujinami, R.S.
J. Exp. Med. 170, 2017-2049, 1989
A;Title: Alteration of amiso acid 101 within capsid protein VP-1 changes the pathogen A;Reference number: Piol84; MJID:90063468; PMID:2479706
                                                                                                                                                                                                                                                                                                                                                                                                            Cyncusbion: Aprilon

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ò
seed protein ws.5 - winged bean (fragment)
C;Species: Psophocarpus tetragonolobus (winged bean)
C;Species: Psophocarpus tetragonolobus (winged bean)
C;Accession: E61491
C;Accession: E61491
C;Accession: B, 115-130, 1989
C;Accession: B, 115-130, 1989
A;Title: Microsequence analysis of winged bean seed proteins electroblotted from two-dim A;Retenore number: A61491; MUID:8935:606; PMID:2765119
